Meeting Notes - 28 August 2015

Meeting: Hussein and Darryl

- Organise design group (DL lab group)
- Planning for paper prototype
- Design documentation

The above is dependant on:

Ingestion Manager

- should be seamless (no separate login)
- No separate authentication (OAuth)
- Don't want to validate 1000 items each (rather validate per batch)
- Create a repo for the Ingestion manager, Report Writer and Mappers
- Look into DSpace map file for batch retractions
- If not possible to use DSpace-API use command line interface
- There will be different roles (Managers (e.g. NRF person who validates submission), User (e.g. the person who submits), Admin (e.g. the DSpace admin))
- Documentation for DSpace-API maybe in previous versions

Report Writer

- Demonstrate to Hussein at next meeting (7 September 2015)

Next meeting (Darryl only): Monday 7 September 2015

Image of the drawing the Hussein made of the UI and interaction the Manager and User roles will have.

- User submits batch.
- Submission is held in a waiting area until the submission can be made.
- Manager can validate a batch (possibly drill-down into batch to inspect and fix errors).
- Transformation of metadata (Craig's mappers) can occur either before or after the submission is validated. (probably best to do it after; in the that the submission is rejected the unnecessary mapping work would not have been done)
